

Total Maximum Daily Load Information Sheet

South Fork Salt River

Water Body ID: 0142

Water Body Segment at a Glance:

Counties:	Callaway and Audrain
Nearby City:	Mexico
Length:	40.1 miles
Pollutant:	Low dissolved oxygen
Source:	Mexico wastewater treatment plant and unknown

State Map Showing Location of Watershed

Schedule for TMDL development:

TMDL development schedules are subject to change.

The most current schedule for TMDL development is available on the department's website at dnr.mo.gov/env/wpp/tmdl/wpc-tmdl-progress.htm

Description of the Problem

A water body is considered impaired when it fails to meet applicable water quality standards. Water quality standards consist of designated uses, water quality criteria, an antidegradation policy and implementation procedures. The South Fork Salt River is impaired due to exceedances of state water quality criteria that protect aquatic life.

Designated uses of the South Fork Salt River*

- Warm Water Habitat (WWH)
- Whole Body Contact Recreation Category B (WBC-B)
- Secondary Contact Recreation (SCR)
- Human Health Protection (HHP)
- Irrigation (IRR)
- Livestock and Wildlife Protection (LWP)

*In addition to these specific uses, all waters of the state are protected by the general water quality criteria that are specified in the state's Water Quality Standards at 10 CSR 20-7.031(4).

Designated use that is impaired

- Warm Water Habitat (WWH)

Criteria that apply

- In the Missouri Water Quality Standards at 10 CSR 20-7.031 Table A, the criterion for dissolved oxygen for waters designated as warm water habitat is a minimum 5 mg/L.

Assessment and water quality data

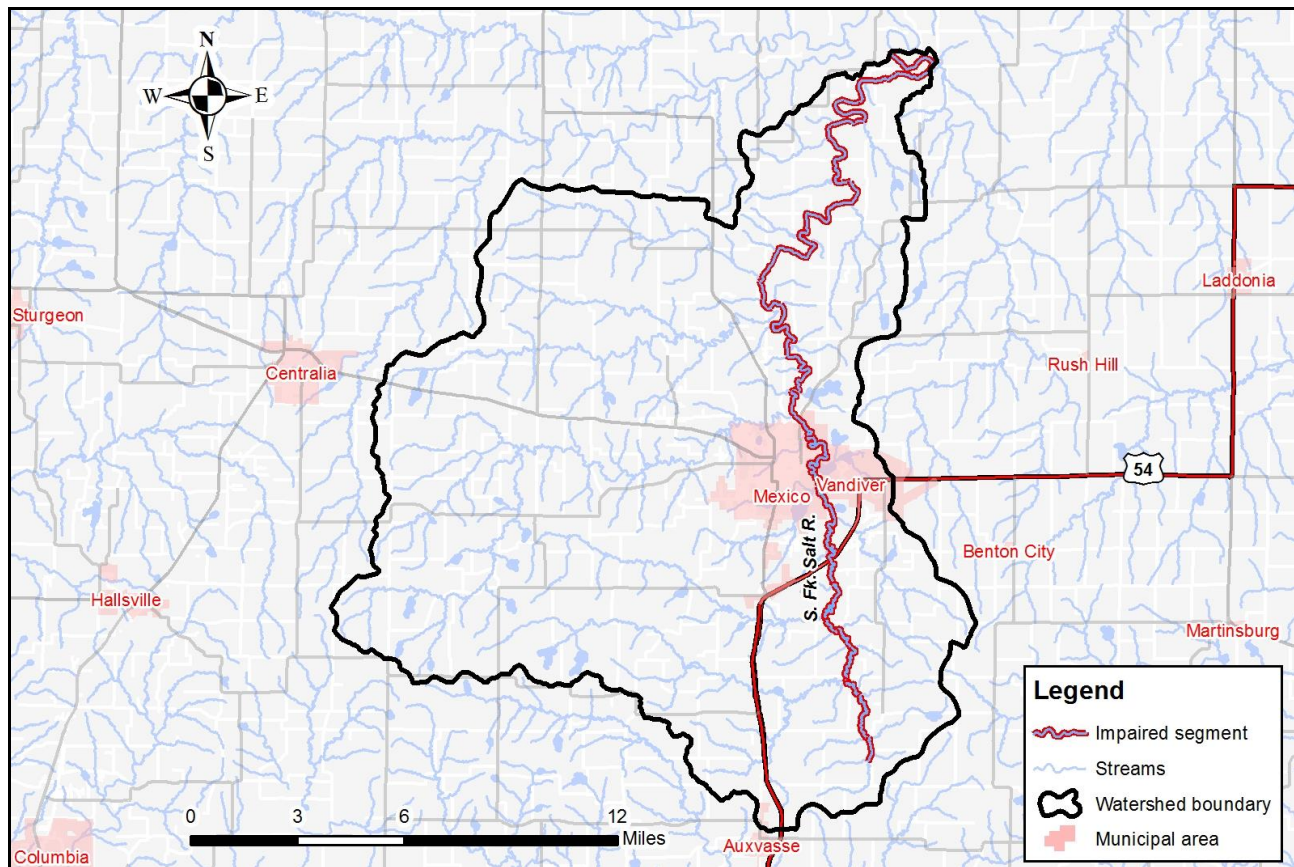

Dissolved oxygen is important as many aquatic organisms require high levels of oxygen to survive. The department judges a water body to be impaired due to low dissolved oxygen if more than 10 percent of measurements fail to meet the water quality criterion. In the case of the South Fork Salt River, six of 15 samples, or 40 percent, did not meet the water quality criterion.

TMDL for South Fork Salt River

The South Fork Salt River TMDL will calculate the maximum amount of each listed pollutant that the stream can receive and still meet water quality standards. The TMDL will also identify all potential or suspected pollutant sources in the watershed and distribute the allowable pollutant loads among those various sources. When developed, the South Fork Salt River TMDL will use the most current and available data. For this reason, the final TMDL may present information that differs from that contained in this information sheet.
